

Conveyor Components

Hubei Xin Aneng as the professional manufacturer of high quality Conveyor Components with guarantee 30,000hrs in normal working conditions. At XAN, we focus on production management, down to the cleanliness of the factory floor. We believe that production management reflects product quality. Only by holding ourselves to strict standards can we produce highquality products and serve our customers effectively. Send Inquiry

The main technical parameters of The Conveyor Components include the following aspects: 1. Diameter: The diameter of The Conveyor Components is one of its most critical parameters, which determines the load-bearing capacity and

Product Description

108mm, 133mm, 159mm, 194mm, 219mm, etc. The larger the diameter, the stronger the load-bearing capacity and the wider the scope of application. 2. Length: The length of The Conveyor components is generally between 200mm and 2000mm, but there are also special size rollers, such as steel rollers with a length of up to 4000mm. The length mainly affects the transportation capacity and scope of application of the roller. Longer rollers are suitable for larger logistics equipment and occasions where the goods are transported for a long time.

stability of the roller. Common wheel diameter sizes include 38mm, 50mm, 60mm, 76mm, 89mm, 102mm, etc. There are also larger diameters such as

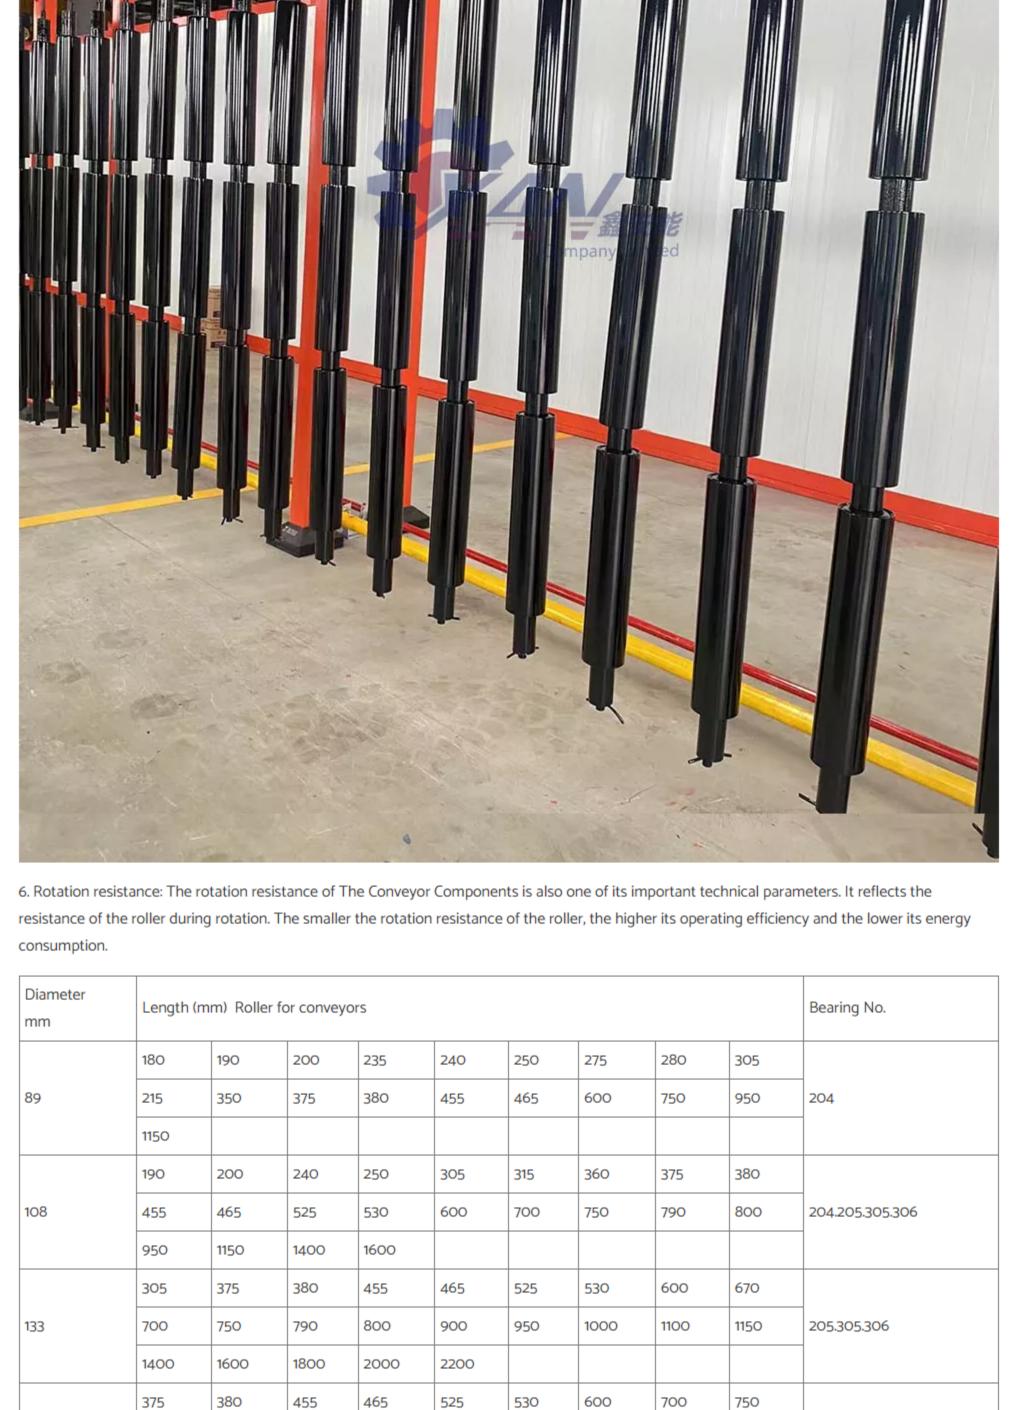

天使星页任里如 3. Width: The width of The Conveyor Components is generally 300mm, 400mm, 500mm, 600mm, 700mm, etc. Larger rollers can also reach 1200mm. The width mainly determines the load-bearing capacity and application range of the roller. Generally speaking, the roller with a larger width has a stronger load-bearing capacity, but it is not suitable for use in a small working space. 4. Material: The material of The Conveyor Components is also one of its important technical parameters. Common materials include Q235, 45# steel, etc. Idlers made of different materials have different wear resistance, load-bearing capacity and service life. 5. Arrangement spacing: Different types of The Conveyor Components have different arrangement spacing requirements. For example, the arrangement spacing of trough rollers shall not be greater than 1200mm, and one set of upper-centering rollers shall be provided for every 10 groups

alleviate the impact of materials on the conveyor belt. The buffer rollers under the guide trough are arranged at a distance of ≤600mm.

of trough rollers (normal spacing arrangement); the arrangement spacing of parallel rollers shall not be greater than 3000mm, and every 8 groups of

return rollers shall be arranged. There is a set of lower centering rollers; the buffer rollers are installed at the loading area of the belt conveyor to
