Product Description

Also can be called honey comb, super grip belt , or grip top belt.

It is engineered with a textured and roughened surface to provide enhanced grip and traction. This feature is essential for safely transporting various materials, especially on inclined or angled conveyor systems. The special treated rough surface of the belt is excellent for absorbing vibration and increasing friction, which helps to protect the materials from slipping. These belts are commonly used in various industries such as airports, theme parks, logistic centers, and breweries.

Rough top belts can be made of different rubber compounds and come in various colors. They are also available in different widths and lengths to meet specific application requirements. Some common features of rough top belts include:

- Anti-slip top cover rubber surface to prevent goods from slipping.
- Ability to transport goods at an inclination of up to 30 degrees.
- High tensile strength and durability.
- Resistance to abrasion, impact, and various environmental factors.

Overall, rough top belts play a crucial role in material handling systems, providing efficient and reliable transportation of goods in different industrial settings.
